1. PROJECT OVERVIEW

Court 474 Ltd manages a short-let property with **29 apartments** (25 one-bedroom + 4 two-bedroom) and a **40-seater conference room**, all owned by multiple subscribers. Beyond the booking and guest management handled by Spacer, the day-to-day facility operations — cleaning, procurement, staff coordination, maintenance, and cost tracking — require their own dedicated system.

This document outlines the **Facility Management System** we will build for Court 474 — a custom solution that integrates with Spacer to automate the operational side of managing 29 apartments and a conference room. It covers cleaning workflows, procurement, staff management, maintenance tracking, cost analytics, and service charge administration.

What this system delivers:

- Automated cleaning workflows triggered by guest checkout from Spacer
- Procurement tracking with auto-restock alerts for apartment consumables
- Staff scheduling and performance tracking tied to occupancy levels
- Maintenance request and resolution tracking per apartment
- Cost analytics — P&L; per apartment, utility tracking, cost trends
- Service charge tracking — which owners have paid, who's overdue
- Facility management dashboard — bird's eye view of the entire operation

2. THE PROBLEMS WE ARE SOLVING

A. Cleaning Coordination

With 29 apartments turning over guests on different schedules, cleaning coordination becomes a daily logistics challenge. Without a system, cleaning assignments happen via WhatsApp and phone calls. There's no visibility into which apartments need cleaning, which are ready, or how long cleaning takes. Apartments may sit unbooked simply because no one flagged them as ready.

B. Procurement Waste

Each apartment needs toiletries, linens, cleaning supplies, and other consumables. Without tracking, procurement is either reactive (run out and scramble) or wasteful (over-order and stockpile). There's no visibility into actual consumption per apartment or cost trends over time.

C. Staff Management

Cleaning staff, security, and maintenance personnel need to be scheduled based on actual occupancy, not guesswork. During low-occupancy periods, staff costs should scale down. During peak periods, additional support should be flagged in advance.

D. Maintenance Tracking

When something breaks in an apartment — a leaking tap, a faulty AC, a damaged fixture — it needs to be reported, tracked, assigned, and resolved. Without a system, maintenance requests get lost in WhatsApp threads and repairs are delayed.

E. Cost Visibility

Court 474 needs to know the actual cost of managing each apartment — cleaning costs, consumables, utilities, maintenance, and staff time. Without this, it's impossible to set accurate agency charges, identify unprofitable units, or make informed operational decisions.

F. Service Charge Administration

All apartment owners pay a fixed service charge for general facility management (security, water, common area cleaning). Tracking who has paid, who's overdue, and sending reminders needs to be automated — not managed in a spreadsheet.

3. CLEANING AUTOMATION

The cleaning module integrates directly with Spacer. When a guest checks out, the facility management system automatically picks it up and triggers the cleaning workflow.

How it works:

1. **Guest checks out via Spacer** — the facility management system receives the event automatically
2. **Apartment flagged for cleaning** — status changes to “Needs Cleaning” on the dashboard
3. **Cleaning staff assigned** — system assigns based on availability and current workload
4. **Staff notified** — cleaning staff receives a notification (SMS/app) with the apartment number
5. **Cleaning completed** — staff marks the apartment as “Ready” in the system
6. **Spacer updated** — the apartment is automatically returned to the booking pool in Spacer

What the system tracks:

- Cleaning time per apartment (start to finish)
- Cleaning frequency per apartment per month
- Cost per cleaning (if cleaning staff are paid per job)
- Average turnaround time (checkout to ready)
- Staff workload distribution — who’s handling the most/fewest apartments

The key benefit: no apartment sits idle because someone forgot to flag it as clean. The system ensures every checkout triggers a cleaning assignment, and every cleaned apartment returns to Spacer’s booking pool automatically.

4. PROCUREMENT & INVENTORY MANAGEMENT

Every apartment needs consumables — toiletries, linens, towels, cleaning products, light bulbs, and other supplies. The procurement module tracks what's being used and ensures restocking happens before anything runs out.

Inventory Tracking

- Each apartment has an inventory profile listing all consumables and their quantities
- After each cleaning, staff logs what was restocked (e.g., 2 soap bars, 1 set of towels)
- System deducts from central inventory and tracks usage per apartment
- Dashboard shows current stock levels for all items across the property

Auto-Restock Alerts

- Each item has a minimum threshold (e.g., when soap drops below 50 units, alert)
- System sends alerts to the procurement manager when thresholds are reached
- Alerts include the item, current quantity, and suggested reorder quantity based on usage history

Procurement Reports

- Monthly procurement cost per apartment
- Cost trends over time (is procurement spending going up or down?)
- Actual usage vs. purchase — identifies waste or theft
- Top items by cost and by frequency

5. STAFF SCHEDULING & PERFORMANCE

The system uses occupancy data from Spacer to help Court 474 manage staffing levels intelligently.

Occupancy-Based Scheduling

- System knows upcoming check-ins and check-outs from Spacer
- Suggests optimal cleaning staff schedule for the week based on expected turnovers
- Low occupancy week reduce cleaning shifts, save on staff costs
- High occupancy weekend alert for additional support in advance

Performance Tracking

- Cleaning time per staff member — who's fast, who's slow
- Number of apartments cleaned per day/week
- Guest ratings per apartment (if feedback is collected) — correlate with cleaning staff
- Attendance and shift tracking

Staff Roles

- **Cleaning staff** — receive cleaning assignments, mark apartments ready
- **Maintenance staff** — receive and resolve maintenance requests
- **Facility manager** — oversees all operations from the dashboard
- **Procurement manager** — manages inventory and restocking

6. MAINTENANCE TRACKING

When something needs fixing in an apartment or a common area, the maintenance module ensures it's logged, assigned, tracked, and resolved.

How it works:

1. **Issue reported** — by cleaning staff (during cleaning), facility manager, or apartment owner
2. **Categorised** — plumbing, electrical, AC, fixtures, structural, etc.
3. **Priority assigned** — urgent, normal, low
4. **Assigned to maintenance staff** — or flagged for external contractor
5. **Resolution logged** — what was done, cost, time taken
6. **Apartment status updated** — if the apartment was taken offline for repair, it's returned to ready

Maintenance Reports:

- Open issues by apartment and by category
- Resolution time (average and per issue)
- Maintenance cost per apartment per month
- Recurring issues — which apartments or categories have the most problems

7. COST ANALYTICS & P&L PER APARTMENT

The system pulls revenue data from Spacer and cost data from its own modules (cleaning, procurement, maintenance, utilities) to produce a complete financial picture per apartment.

Per Apartment:

- **Revenue** — total booking revenue (from Spacer)
- **Agency charge earned** — Court 474's share
- **Cleaning cost** — total cleaning spend for the apartment
- **Consumables cost** — toiletries, linens, supplies
- **Maintenance cost** — repairs and fixes
- **Utility cost** — electricity, water (if metered per apartment)
- **Net profit/loss** — revenue minus all costs

For the Facility Overall:

- Total revenue across all apartments + conference room
- Total agency charges earned
- Total operational costs (cleaning + procurement + maintenance + utilities + staff)
- Net facility P&L;
- Monthly and quarterly trend reports
- Most profitable and least profitable apartments

8. SERVICE CHARGE ADMINISTRATION

All apartment owners pay a fixed service charge to Court 474 for general facility management (security, water supply, common area maintenance). The system tracks this:

- **Charge schedule** — monthly or quarterly billing per apartment owner
- **Payment tracking** — who has paid, who's overdue, outstanding amounts
- **Automated reminders** — email/SMS reminders for upcoming and overdue payments
- **Payment history** — full record per owner
- **Reports** — total service charges collected vs. expected, delinquency rate

9. FACILITY MANAGEMENT DASHBOARD

The central hub for Court 474's operations team — a single screen that shows the state of the entire property at a glance.

- **Real-time apartment status map** — visual grid: occupied, available, needs cleaning, under maintenance, blocked by owner
- **Today's activity** — check-ins, check-outs, cleaning assignments, maintenance tasks
- **Financial overview** — total revenue, agency charges, operational costs, net position
- **Staff view** — who's on shift, current assignments, workload
- **Maintenance queue** — open issues by priority
- **Inventory alerts** — items below restock threshold
- **Service charge status** — paid, pending, overdue per owner
- **Security log** — integration with security systems if applicable

10. TECHNICAL APPROACH

Component	Technology
Frontend	Next.js + React
Backend	Node.js (NestJS)
Database	PostgreSQL
Spacer Integration	API integration for checkout events, occupancy data, and revenue data
Cloud	Microsoft Azure
Infrastructure	Terraform
Notifications	Email + SMS (cleaning assignments, restock alerts, service charge reminders)
Security	OWASP standard, role-based access control

The Facility Management System is built as a standalone application that communicates with Spacer via API. Checkout events, occupancy data, and revenue figures flow from Spacer into this system automatically — no manual data entry needed.

11. INVESTMENT

Item	Cost (NGN)
Cleaning Automation Module	Included
Procurement & Inventory Management Module	Included
Staff Scheduling & Performance Module	Included
Maintenance Tracking Module	Included
Cost Analytics & P&L Module	Included
Service Charge Administration	Included
Facility Management Dashboard	Included
Spacer API Integration	Included
Training & Handover	Included
Total Facility Management System	**₦8,000,000**

Combined Investment (Spacer + Facility Management)

Component	Cost (NGN)
Spacer Platform Setup & Deployment	₦10,000,000
Smart Home Synchronisation	₦2,000,000
Facility Management System	₦8,000,000
Total Investment	**₦20,000,000**

WHY ALGOLOG

Algolog Limited is a Nigerian technology company committed to ensuring businesses across Africa get the technology they need to build their future, improve their sales, and strengthen their operations.

Our work includes:

- **Spacer** (spacer.so) — Smart hospitality and workspace management platform, deployed across multiple properties in Abuja, Kaduna, and Lagos
- **DeepThread** (deepthread.ai) — AI-powered cross-platform context engine
- **Visora** (visora-ai.com) — AI-powered data analytics and insights platform
- **PrivateTransfer** (privatetransfer.ng) — Secure transfer platform

NEXT STEP

We'd love to discuss the facility management requirements in more detail — the staffing structure, the service charge arrangements, procurement workflows, and how the system should integrate with Spacer for Court 474's specific operation.

Whenever you're ready, reach out to:
